

PRINCIPLES

ENVIRONMENTAL PROTECTION

FOCUSING ON FUTURE-ORIENTED SYSTEM SOLUTIONS

The protection of increasingly scarce raw materials and the development of innovative systems for efficient energy use are crucial future topics that REHAU is already successfully addressing also within the spirit of sustainability.. We not only develop and manufacture system solutions that are ecologically and economically practical for our customers, but we also act responsibly with regard to people and nature in all of our efforts.

We promote our employees' sense of personal responsibility for continually improving environmental protection and commit ourselves to complying with legal and other voluntary requirements. Together we set goals to reduce the consumption of resources and ensure their achievement through successful programs and individual measures. We provide our customers with extensive information about the environmental aspects of our products, and we consider environmental policy criteria in the selection of our suppliers.

We take environmental impacts of any kind very seriously. They are strictly monitored at all our locations around the world. We begin assessing environmental effects in the planning phase of new activities, new products and new procedures. We also incorporate comprehensive measures to deal with accidental emissions.
